

CP632 STRAIGHT (SYNTHETIC) ENAMEL CATALYST

CP-632 is an excellent straight enamel catalyst. It causes straight or synthetic enamels to cure quickly to a super durable finish with excellent gloss. The most common problem with straight enamel paint is the vulnerability to solvent spills, such as gasoline. CP-632 gives good resistance to gasoline spills. Straight enamel catalyst is mixed differently than acrylic enamel catalysts. CP- 632 **MUST** be added to the enamel paint, **AFTER IT HAS BEEN THINNED**. You must still use only one pint catalyst per one gallon of paint; however, it will not blend correctly if added to unthinned paint. CP-632 is most commonly sold for the RM Super Max system. We offer a great advantage in that one pint of CP-632 will activate one gallon of Super Max whereas RM 895 activator requires one quart. CP-632 is also an excellent activator for most all straight enamel systems.
