

## **CP651 URETHANE ACTIVATOR**

CP-651 Urethane Activator is truly a universal activator. Most competitive brands will work on polyurethane enamels and urethane paint; however, they will cause acrylic urethanes to dull considerably. CP-651 will not cause any dulling effect in acrylic urethanes and provides excellent activation and fast drying time. Super high gloss is retained in the curing process. Urethane activator should be used in accordance with the mixing instructions for each individual brand of paint. The respective mixing ratios should be followed exactly. CP-651 is the most effective activator available for \*DuPont Imron. It will activate \*Imron faster than 192S (\*DuPont Activator) and still maintain the same gloss.

\*Disclaimer: DuPont, and Imron are registered trademark of DuPont Company. DuPont does not manufacture, endorse or warranty this product.
